pH Revision hair removal

DMK's unique pain-free hair removal system is a great alternative to laser treatments, especially for those fine hairs that laser struggles to remove.

The treatment gently dissolves the hair whilst also working to reduce hair re-growth with continued use, anywhere on the face or body. This treatment can improve conditions like ingrown hairs, folliculitis and acne affected skin through its hair removing capabilities and bacteria killing properties.

Your skin will be hair free
and velvety smooth!

Why pH Revision is best

pH revision is better for removing facial hair as it is designed to improve the skin texture and colour at the same time. Waxing can cause the area to go darker, but pH Revision aims to lighten the area being depilated. pH Revision aims to weaken hair and reduce its growth over time for long-lasting results and fresh glowing skin.

What areas can it treat:

- Lip
- Chin
- Face
- Bikini
- Underarm
- Leg
- Nipple
- Buttock
- Back & stomach

Other uses:

- Darker skin that suffers pigmentation with waxing
- Embedded and congested hair follicles
- Excessive facial hair caused by acne

How often do I need this done?

Every six to eight weeks until the growth weakens, then only maintenance sessions are applicable.
